1.0 Introduction

It is the policy of The Ohio State University (OSU) to take precautions to eliminate potential hazards in the workplace. The purpose of this Silica Dust Safety Program is to identify the hazards associated with respirable silica dust and outline the steps to take to ensure employees who work with, or around silica are not exposed to hazardous levels of silica dust. Additionally, this program is to provide procedures for common silica related work duties to minimize exposure in accordance with the Occupational Safety and Health Administration (OSHA) standards 29 CFR 1910.1053(I) for general industry and maritime, 29 CFR 1926.1153(k) for construction and 29 CFR 1910.1000 Air Contaminants.

Crystalline silica is a basic component of soil, sand, granite and many other minerals. Quartz is the most common form of crystalline silica. All materials containing silica can result in the presence of respirable silica particles when chipping, cutting, drilling or grinding takes place. Silica exposure occurs through inhalation of silica containing particles and occurs through many construction and general industry activities. The most severe exposures generally occur during abrasive blasting with sand to remove paint and rust from bridges, tanks, concrete structures and other surfaces. Other activities that may result in sever silica exposure include jack hammering, rock/well drilling, concrete mixing, concrete drilling, brick and concrete cutting/sawing, tuck pointing and tunneling operations. Exposure to excessive silica dust over long periods of time can result in silicosis.

This Silica Dust Safety Program applies to OSU employees who are expected to be exposed to silica dust through the methods outlined above; or through other means, which are determined by EHS or their supervisor.

2.0 Responsibilities

- 2.1 Environmental Health & Safety
 - 2.1.1 Environmental Health & Safety (EHS) provides program oversight and consultation to OSU work groups regarding potential risks, exposure prevention and training relating to silica dust exposures.
 - 2.1.2 Conduct building/material assessments for silica containing materials and perform employee silica hazard assessments/monitoring upon request.
 - 2.1.3 Create an exposure control plan in consultation with department supervisors.
 - 2.1.4 Review this program annually.
- 2.2 OSU Department (Facilities Operations & Development (FOD); Athletics; OSU Medical Center (OSUMC); Student Life; et. al.)
 - 2.2.1 Each department with responsibilities for maintaining buildings or working in buildings with potential exposure to silica should:
 - 2.2.1.1 Ensure the applicable components of the Silica Dust Safety Program are available to all affected employees.
 - 2.2.1.2 Provide applicable training to employees expected to work in, or with, building materials where there is a potential risk for silica exposure.
 - 2.2.1.3 Provide appropriate equipment to comply with the OSHA standard.
 - 2.2.1.4 Coordinate with EHS to schedule exposure monitoring.
 - 2.2.1.5 Enforce work practices and PPE requirements.

2.2.1.6 Develop housekeeping procedures (refer to section 7.0).

2.3 Supervisors

- 2.3.1 OSU employees who supervise personnel with responsibilities to work in areas where there is a risk of exposure to silica dust, must ensure employees are properly trained on the applicable contents of the Silica Dust Safety Program and are provided appropriate engineering controls.
- 2.3.2 Provide administrative controls when engineering controls are not practical.
- 2.3.3 Provide personal protective equipment (PPE) when engineering controls and administrative controls cannot be implemented.

2.4 Authorized Person

- 2.4.1 Employees working in areas where there is an identified risk of silica dust exposure must be properly trained on all applicable elements of the OSU Silica Dust Safety Program; and be provided and utilize the appropriate tools, equipment and PPE for the task being performed.
- 2.4.2 Shall participate in exposure monitoring.
- 2.4.3 Shall use work practices consistent with OSHA Table 1 (see Appendix A).
- 2.4.4 Shall restrict access to the hazardous work area.

3.0 Definitions

3.1 The following definitions are provided to allow for a better understanding of the OSU Silica Dust Safety Program.

Action level a concentration of airborne respirable crystalline silica of 25

µg/m3, calculated as an 8-hour TWA.

Authorized person: An employee who has received proper training and exposure

monitoring to safely work with silica containing materials.

Crystalline silica: Naturally occurring component in earth soils, sand, granite

and many other minerals resulting in many building materials

containing silica.

Exposure Assessment: The initial determination to find if any employee may be

exposed to lead at or above the permissible exposure level. Until the assessment is completed, employees shall take all precautions necessary to maintain exposures below the PEL.

HEPA: High Efficiency Particulate Air. A filtering system capable of

trapping and retaining at least 99.97% of all particles of 0.3

micron in diameter and larger.

Permissible Exposure Limit: (PEL) the OSHA limit for silica dust exposure. It is set at

50μg/m³, averaged over an 8-hour workday, as a TWA.

Silica containing material: Any material, which has the potential to contain silica at levels,

which may pose a hazard to employees when the material is

manipulated to create airborne particles

Silicosis: A lung disease caused by inhalation of silica dust. Silica dust

can cause fluid buildup and scar tissue in the lungs that cuts down the ability for the lungs to fully function. The disease is not curable, but can be prevented through the use of

protective systems.

4.0 Material Assessment

- **4.1** Any time there is a potential for silica containing materials to be involved in a project, sources of silica must be assessed prior to disturbing. OSU Environmental Health & Safety or an authorized contractor can perform building material assessments to determine silica content in materials.
- **4.2** Crystalline silica occurs naturally in the earth's crust and is a basic component of sand, concrete, brick, asphalt, granite, some blasting grit and wall spackling materials. Employees can be exposed to silica when conducting activities such as:
 - Abrasive blasting
 - Jack hammering
 - Concrete crushing
 - Hoe ramming
 - Rock drilling
 - Mixing of concrete or grout
 - Concrete drilling
 - Sawing concrete or bricks

- Chipping or scarifying concrete
- Rock crushing
- Moving or dumping piles of concrete, rock or sand
- Demolition of concrete or brick
- Using coatings containing silica
- Removing coatings containing silica
- **4.3** If airborne silica is expected to be generated during the project, OSU EHS shall be contacted to conduct exposure monitoring and ensure all safety precautions are followed to minimize exposure to airborne silica dust.

5.0 Exposure Monitoring

- 5.1 Exposure Control Plan
 - 5.1.1 The exposure control plan shall include the following:
 - A description of the tasks in the workplace that involve exposure to respirable crystalline silica,
 - A description of the engineering controls, work practices, and respiratory protection used to limit employee exposure to respirable crystalline silica for each task,
 - A description of the housekeeping measures used to limit employee exposure to respirable crystalline silica, and
 - A description of the procedures used to restrict access to work areas, when necessary, to minimize the number of employees exposed to respirable crystalline silica and their level of exposure.
- **5.2** Initial Exposure Monitoring:
 - 5.2.1 OSU employees expected to come in contact/work with silica containing materials where there is a risk of exposure through inhalation of dust should develop an exposure monitoring program.
 - 5.2.2 Initial exposure monitoring should be conducted by OSU EHS to quantitatively evaluate the exposure to airborne silica.
 - 5.2.3 Exposure monitoring should be conducted on any employee exposed to airborne silica dust as levels may vary based on job duty within a project. For example, the employee performing concrete cutting vs an employee providing supervision during the work.
 - 5.2.4 If initial monitoring indicates employee exposures are below the action level (25µg/m³), the monitoring may be discontinued.
 - 5.2.5 Where monitoring indicates any level of silica exposure above the Action Level,

periodic exposure monitoring must be conducted.

- 5.3 Periodic Exposure Monitoring:
 - 5.3.1 Whenever silica exposure levels are greater than the action level (25 μg/m³), periodic exposure monitoring is required. It is the responsibility of the affected department to work with EHS and develop a periodic exposure-monitoring schedule.
 - 5.3.2 Action level means a concentration of airborne respirable crystalline silica of 25 µg/m³, calculated as an 8-hour TWA.
 - 5.3.3 The frequency of exposure monitoring should be as follows:

Measured Concentration:

Monitoring Frequency:

Above the Action Level and less than PEL

25 – 50 µg/m³

Every 6 Months

Above the PEL

• > $50 \mu g/m^3$

Every 3 Months

- 5.3.4 The employer shall reassess exposures whenever a change in the process, control equipment, personnel, or work practices may reasonably be expected to result in new or additional exposures at or above the action level, or when the employer has any reason to believe that new or additional exposures at or above the action level
- **5.4** Termination of Exposure Monitoring:
 - 5.4.1 Periodic exposure monitoring may be discontinued if results from two consecutive sampling periods taken at least 7 days apart show that employee exposure is below the Action level.
- 5.5 Sampling methods
 - 5.5.1 Personal exposure monitoring will be conducted using an approved NIOSH method. Monitoring records shall include the following.
 - 5.4.1.1 The date, number, duration, location and results of each of the samples taken, including a description of the sampling procedure used to determine representative employee exposure where applicable.
 - 5.4.1.2 A description of the sampling and analytical methods used.
 - 5.4.1.3 The type of respiratory protective devices, if any.
 - 5.4.1.4 Name and job classification of the employee monitored.
 - 5.4.1.5 Any environmental variables that could affect the measurement of the employee exposure.
- 5.5 Reporting of exposure monitoring results
 - 5.5.1 EHS will notify the department/supervisor of exposure monitoring results within as soon as the final laboratory analysis is completed. The department/supervisor must provide this information to the affected employee(s) within 15 working days.
 - 5.5.2 If, during the exposure monitoring, levels are measured which exceed the PEL, the EHS report will include steps and controls to reduce exposure to below the PEL.

5.5.3 Follow up exposure monitoring may be necessary if engineering or administrative controls are put in place to reduce hazardous exposures.

6.0 Exposure Control

- **6.1** Pre-project planning
 - 6.1.1 Prior to projects taking place affecting OSU buildings/facilities, EHS reviews planning documents to account for potential exposures to hazardous materials, including silica.
 - 6.1.2 EHS can conduct building material assessments to make determinations if there are any silica containing materials which may be impacted by the project.
 - 6.1.3 Any silica containing materials are addressed and methods for exposure control are provided by EHS prior to work beginning.
 - 6.1.4 If silica containing materials are to be disturbed during the project, the appropriate exposure control methods will be recommended by EHS.
- 6.2 Administrative/Engineering Controls
 - 6.2.1 Where silica exposures at or above the Permissible Exposure Limit have been documented, or are expected, the appropriate engineering or administrative controls will be implemented, where feasible. Follow-up exposure monitoring may be necessary when administrative or engineering exposure controls are utilized. Refer to Appendix A for additional information.
 - 6.2.2 Typical controls may involve:
 - 6.2.2.1 Substituting non-silica containing materials for use while abrasive blasting
 - 6.2.2.2 Alternative methods such as pre ordering grout already mixed instead of onsite mixing in bulk
 - 6.2.2.3 Local exhaust ventilation
 - 6.2.2.4 General ventilation
 - 6.2.2.5 limit worker access to high exposure areas
 - 6.2.2.6 Vacuum methods with HEPA filters
 - 6.2.2.7 Distance
 - 6.2.2.8 Dust control products
 - 6.2.2.9 Containment
 - 6.2.2.10 Use of water to keep dust down
 - 6.2.2.11 General work practices such as good housekeeping, , development of specific SOPs to minimize exposure
- **6.3** Personal Protective Equipment (PPE)
 - 6.3.1 In addition to administrative/engineering controls, employees may be required to wear specific PPE during the disturbance of silica containing materials and/or when airborne

silica is present. The level of protection will depend on the task being conducted and the tools being utilized to complete the task.

- 6.3.2 Recommended PPE will typically include:
 - 6.3.2.1 Respiratory Protection
 - 6.3.2.1.1 Employees utilizing a respirator must adhere to the policies outlined in the OSU Respiratory Protection Program.
 - 6.3.2.2 Disposable or reusable work clothing to keep from spreading the dust or bringing the dust home
 - 6.3.2.3 Leather gloves
 - 6.3.2.4 Safety glasses or goggles
 - 6.3.2.5 Face shield

6.3.2.6 Boot covers or rubber boots

6.3.3 The following table provides recommended respiratory protection levels based on the measured or anticipated exposure levels:

| Respirator | Protection Factor | Typical Silica Activity |
|-----------------------------|--------------------------------|--|
| N95 | Less than 50 μg/m ³ | - Used on voluntary basis to control low exposures |
| Half-face with HEPA filters | 50 – 500 μg/m³ | Housekeeping (wet method) Saw cutting (wet method) Drilling concrete (wet method) Power tools with dust collection Equipment operating with open cab |
| Full-face with HEPA filters | 500 – 5,000 μg/m³ | Chipping concrete Jack Hammering Power tools without dust collection Mixing grout in bulk Vacuum abrasive blasting |
| SCBA | Above 5,000 μg/m ³ | - Abrasive blasting |

- **6.4** Written Exposure Control Plan Supervisors may consult with EHS to develop and implement a written exposure control plan that contains the following:
 - 6.4.1 A description of the tasks in the workplace that involve exposure to respirable crystalline silica.
 - 6.4.2 A description of the engineering controls, work practices, and respiratory protection used to limit employee exposure to silica.
 - 6.4.3 A description of the housekeeping measures used to limit exposure to silica.

7.0 Housekeeping & Hygiene Facilities

- 7.1 In areas where silica containing dust may be present, all surfaces must be maintained free from accumulations of dust to minimize potential silica exposure. Dust and other silica containing debris must be removed from the work area as soon as possible.
- 7.2 Acceptable method of silica dust removal includes the use of HEPA vacuum or wet methods such as wet mopping.
- **7.3** Unacceptable methods of silica dust removal include dry sweeping, vacuum cleaners, shop vacuums, and compressed air.
- **7.4** Follow all recommended procedures and utilize recommended PPE during silica containing debris cleanup activities.
- **7.5** Where silica containing materials are used, impacted, or being removed; the following requirements must be met.
 - 7.5.1 PPE should be removed upon work completion and disposed of after each use.
 - 7.5.2 Employees must wash hands and are recommended to shower prior to leaving work.
 - 7.5.3 Ensure contaminated PPE, including footwear is not worn outside the work areas.

8.0 Medical Surveillance

- 8.1 Employees exposed to silica levels above the Permissible Exposure Limit (50 μ g/m³), or any employee working with silica who develops signs/symptoms of excessive exposure, should be enrolled in the Medical Surveillance Program.
 - 8.1.1 All medical surveillance will be performed by OSU Employee Health Services and results must be provided the affected employee and their supervisor within 15 days of the assessment.
 - 8.1.2 The medical surveillance program consists of medical and work history, baseline and annual examination and chest X-ray.
- **8.2** Employees enrolled in the medical surveillance program should be examined annually to track any changes as a result to exposure to silica dust.

9.0 Training and Recordkeeping

- **9.1** Hazard Communication training is required by all OSU employees and should be conducted initially upon hiring. Additional information can be found at www.ehs.osu.edu.
- **9.2** Silica Awareness Training is available in person or at www.ehs.osu.edu. And must be offered to affected employees prior to working with silica and annually thereafter.
 - 9.2.1 Silica awareness training should include the following:
 - 9.2.1.1 Information about the potential health effects and symptoms of exposure to respirable silica.
 - 9.2.1.2 Safety data sheets for silica, quartz, and applicable products containing silica
 - 9.2.1.3 The purpose and set up of regulated areas to mark the boundaries of work areas containing silica dust
 - 9.2.1.4 The use of engineering controls, work practices, good housekeeping and PPE to control exposure to silica
 - 9.2.1.5 Use and care of PPE
 - 9.2.1.6 Expected exposures to silica dust
 - 9.2.1.7 Exposure monitoring process
 - 9.2.1.8 Medical surveillance program
 - 9.2.1.9 Identification of competent person
- **9.3** Respiratory protection training, medical clearance, and quantitative fit testing is required under the Respiratory Protection Program. Contact EHS for additional information regarding enrollment in the program.
- **9.4** The supervisor is required to maintain all training, medical surveillance, and exposure monitoring results.

10.0 Signage

- **10.1** Supervisors must establish regulated areas wherever employee exposure to silica is expected to exceed the PEL.
 - 10.1.1 Regulated areas must be demarcated from the rest of the workplace in a manner to minimize the number of employees exposed to silica.
 - 10.1.2 In regulated areas where exposure to silica dust may exceed the PEL the following type of signage must be in place to warn employee of hazards.

10.1.3 Access to regulated areas is permitted only be employees required to perform work in the area; personnel conducting exposure monitoring; or other personnel as approved by supervisors and EHS.

Appendix A

OSHA Table 1

Table 1—Specified Exposure Control Methods When Working With Materials Containing Crystalline Silica

| | Engineering and wark processes control | Required respiratory protection and minimum assigned protection factor (APF) | |
|--|--|--|----------------|
| Equipment/task | Engineering and work practice control methods | ≤ 4 hours/shift | >4 hours/shift |
| (i) Stationary masonry saws | Use saw equipped with integrated water delivery system that continuously feeds water to the blade Operate and maintain tool in accordance with manufacturer's instructions to minimize dust emissions | None | None |
| (ii) Handheld power saws (any blade diameter) | system that continuously feeds water to the blade Operate and maintain tool in accordance with manufacturer's instructions to minimize dust emissions: | | |
| | -When used outdoors | None | APF 10 |
| | -When used indoors or in an enclosed area | APF 10 | APF 10 |
| (iii) Handheld power saws for cutting fiber-cement board (with blade diameter of 8 inches or less) | For tasks performed outdoors only: Use saw equipped with commercially available dust collection system Operate and maintain tool in accordance with manufacturer's instructions to minimize dust emissions Dust collector must provide the air flow recommended by the tool manufacturer, or greater, and have a filter with 99% or greater efficiency | None | None |
| (iv) Walk-behind saws | Use saw equipped with integrated water delivery system that continuously feeds water to the blade Operate and maintain tool in accordance with manufacturer's instructions to minimize dust emissions: | | |
| | -When used outdoors | None | None |
| | -When used indoors or in an enclosed area | APF 10 | APF 10 |
| (v) Drivable saws | For tasks performed outdoors only: | | |
| | Use saw equipped with integrated water delivery system that continuously feeds water to the blade Operate and maintain tool in accordance with manufacturer's instructions to minimize dust emissions | None | None |
| (vi) Rig-mounted core saws or drills | Use tool equipped with integrated water delivery system that supplies water to cutting surface Operate and maintain tool in accordance with manufacturer's instructions to minimize dust emissions | None | None |

| | Engineering and work practice central | Required respiratory protection and minimum assigned protection factor (APF) | |
|---|--|--|----------------|
| Equipment/task | Engineering and work practice control methods | ≤ 4 hours/shift | >4 hours/shift |
| (vii) Handheld and stand-mounted drills (including impact and rotary hammer drills) | Use drill equipped with commercially available shroud or cowling with dust collection system Operate and maintain tool in accordance with manufacturer's instructions to minimize dust emissions Dust collector must provide the air flow recommended by the tool manufacturer, or greater, and have a filter with 99% or greater efficiency and a filter-cleaning mechanism Use a HEPA-filtered vacuum when cleaning holes | None | None |
| (viii) Dowel drilling rigs for concrete | For tasks performed outdoors only: | | |
| | Use shroud around drill bit with a dust collection system. Dust collector must have a filter with 99% or greater efficiency and a filter-cleaning mechanism | APF 10 | APF 10 |
| (ix) Vehicle-mounted drilling rigs for rock and concrete | Use dust collection system with close capture hood or shroud around drill bit with a low-flow water spray to wet the dust at the discharge point from the dust collector | None | None |
| | OR | | |
| | Operate from within an enclosed cab and use water for dust suppression on drill bit | None | None |
| (x) Jackhammers and handheld powered chipping tools | Use tool with water delivery system that supplies a continuous stream or spray of water at the point of impact: | | |
| | -When used outdoors | None | APF 10 |
| | -When used indoors or in an enclosed area | APF 10 | APF 10 |
| | OR | | |
| | Use tool equipped with commercially available shroud and dust collection system | | |
| | Operate and maintain tool in accordance with manufacturer's instructions to minimize dust emissions | | |
| | Dust collector must provide the air flow recommended by the tool manufacturer, or greater, and have a filter with 99% or greater efficiency and a filter-cleaning mechanism: | | |
| | -When used outdoors | None | APF 10 |
| | -When used indoors or in an enclosed area | APF 10 | APF 10 |
| (xi) Handheld grinders for mortar removal (i.e., tuckpointing) | Use grinder equipped with commercially available shroud and dust collection system | APF 10 | APF 25 |

| | Engineering and work practice control | Required respiratory protection and minimum assigned protection facto (APF) | |
|--|---|---|----------------|
| Equipment/task | Engineering and work practice control methods | ≤ 4 hours/shift | >4 hours/shift |
| | Operate and maintain tool in accordance with manufacturer's instructions to minimize dust emissions | | |
| | Dust collector must provide 25 cubic feet per minute (cfm) or greater of airflow per inch of wheel diameter and have a filter with 99% or greater efficiency and a cyclonic pre-separator or filter-cleaning mechanism | | |
| (xii) Handheld grinders for uses other than mortar removal | For tasks performed outdoors only: Use grinder equipped with integrated water delivery system that continuously feeds water to the grinding surface | None | None |
| | Operate and maintain tool in accordance with manufacturer's instructions to minimize dust emissions | | |
| | OR | | |
| | Use grinder equipped with commercially available shroud and dust collection system | | |
| | Operate and maintain tool in accordance with manufacturer's instructions to minimize dust emissions | | |
| | Dust collector must provide 25 cubic feet per minute (cfm) or greater of airflow per inch of wheel diameter and have a filter with 99% or greater efficiency and a cyclonic pre-separator or filter-cleaning mechanism: | | |
| | -When used outdoors | None | None |
| | -When used indoors or in an enclosed area | None | APF 10 |
| (xiii) Walk-behind milling machines and floor grinders | Use machine equipped with integrated water delivery system that continuously feeds water to the cutting surface | None | None |
| | Operate and maintain tool in accordance with manufacturer's instructions to minimize dust emissions | | |
| | OR | | |
| | Use machine equipped with dust collection system recommended by the manufacturer | None | None |
| | Operate and maintain tool in accordance with manufacturer's instructions to minimize dust emissions | | |
| | Dust collector must provide the air flow recommended by the manufacturer, or greater, | | |

| | Engineering and work practice control | Required respiratory protection and minimum assigned protection facto (APF) | |
|---|--|---|----------------|
| Equipment/task | Engineering and work practice control methods | ≤ 4 hours/shift | >4 hours/shift |
| | and have a filter with 99% or greater efficiency and a filter-cleaning mechanism | | |
| | When used indoors or in an enclosed area, use a HEPA-filtered vacuum to remove loose dust in between passes | | |
| (xiv) Small drivable milling machines (less than half-lane) | Use a machine equipped with supplemental water sprays designed to suppress dust. Water must be combined with a surfactant | None | None |
| | Operate and maintain machine to minimize dust emissions | | |
| (xv) Large drivable milling machines (half-lane and larger) | For cuts of any depth on asphalt only: Use machine equipped with exhaust ventilation on drum enclosure and supplemental water sprays designed to suppress dust | None | None |
| | Operate and maintain machine to minimize dust emissions | | |
| | For cuts of four inches in depth or less on any substrate: | | |
| | Use machine equipped with exhaust ventilation on drum enclosure and supplemental water sprays designed to suppress dust | None | None |
| | Operate and maintain machine to minimize dust emissions | | |
| | OR | | |
| | Use a machine equipped with supplemental water spray designed to suppress dust. Water must be combined with a surfactant | None | None |
| | Operate and maintain machine to minimize dust emissions | | |
| (xvi) Crushing machines | Use equipment designed to deliver water spray or mist for dust suppression at crusher and other points where dust is generated (e.g., hoppers, conveyers, sieves/sizing or vibrating components, and discharge points) | None | None |
| | Operate and maintain machine in accordance with manufacturer's instructions to minimize dust emissions | | |
| | Use a ventilated booth that provides fresh, climate-controlled air to the operator, or a remote control station | | |
| (xvii) Heavy equipment and utility | Operate equipment from within an enclosed cab | None | None |
| vehicles used to abrade or fracture silica- | When employees outside of the cab are engaged | None | None |

| | Engineering and work practice control methods | Required respiratory protection and minimum assigned protection factor (APF) | |
|---|---|--|----------------|
| Equipment/task | | ≤ 4 hours/shift | >4 hours/shift |
| containing materials (e.g., hoe-ramming, rock ripping) or used during demolition activities involving silica-containing materials | in the task, apply water and/or dust suppressants as necessary to minimize dust emissions | | |
| (xviii) Heavy equipment and utility vehicles for tasks such as grading and | Apply water and/or dust suppressants as necessary to minimize dust emissions | None | None |
| excavating but not including: Demolishing, abrading, or fracturing | OR | | |
| silica-containing materials | When the equipment operator is the only employee engaged in the task, operate equipment from within an enclosed cab | None | None |
